

PROJECT DEVELOPMENT PHASE

Salesforce Model Performance – ServiceNow

Phase Name	Salesforce Model Performance ServiceNow
Date	03 October 2026
Team ID	6ab6292ddcdae33acb3906da
Project Name	Import Data using Transform Maps

Salesforce Model Performance Testing: The project team shall fill the following information in the model performance testing template. The performance is evaluated based on the successful processing of source data through the ServiceNow Import Set and Transform Map.

S.No.	Parameter	Values	Screenshot
1	Model Summary	ServiceNow data-import automation using an Import Set and Transform Map to map source data into the target table. The process validates field mappings and creates or updates records based on the configured transformation rules.	Paste ServiceNow Transform Map / import result screenshot here.
2	Accuracy	Training Accuracy: Not applicable (no machine-learning model). Validation Accuracy: Not applicable (no machine-learning model). Import validation result: records are checked against the configured field mapping and transformation rules. Successful records are inserted/updated; invalid records are reported as errors.	Paste import result / transform history screenshot here.
3	Confidence Score (Only YOLO Projects)	Not applicable. This is not a YOLO/computer-vision project, so no class detection or confidence score is used.	Not applicable
4	Performance Observation	The Transform Map processes the imported source data according to the configured mappings. Performance is observed through successful processing, record creation/update, and identification of failed or ignored records.	Paste Transform History / import log screenshot here.
5	Expected Result	Source data should be imported into the configured ServiceNow target table. Mapped fields should contain the corresponding source values, and records that do not satisfy the transformation rules should be reported appropriately.	Paste final target-table records screenshot here.

Conclusion: The ServiceNow Transform Map provides a structured mechanism for importing source data into the target table. Since the project does not use a machine-learning or YOLO model, model-specific training, validation, and confidence metrics are not applicable. The main performance indicators are successful record processing, correct field mapping, record creation/update, and error handling.
