

Import data using transform maps

Customer journey map for the administrator and HR manager. Based on the Import Data Using Transform Maps project (MY PRJ): six milestones from table creation to result testing.

SCENARIO Importing, mapping, securing, and testing employee training data from a spreadsheet	Entice How does the need first come up?	Enter What do people experience as they begin the process?	Engage In the core moments in the process, what happens?	Exit What do people experience as the process finishes?	Extend What happens after the process is over?
Steps What does the person typically experience?	Data in a spreadsheet Employee training details are kept in a spreadsheet. Decide to use ServiceNow The admin decides to bring the data in and link each record to an employee. Create the table Create Employee Training Records (u_employee_training_records). Add fields and choices Training Name, Completion Date, Status (choice) and Employee (reference to sys_user).	Create the .xlsx file Four columns: u_training_name, u_completion_date, u_status, u_employee. Download as .xlsx. Open Load Data All > System Import Sets > Load Data. Fill the form Create table; Label Employee Training; Name u_employee_training; sheet 1, header row 1. Submit The import runs and the progress screen shows the result.	Create the transform map Source u_employee_training, target Employee Training Records. Add field maps Map completion date, status, training name and employee. Click Transform Related Links > Transform runs the import. Dot-walk Department Form layout: Employee > Department.	Create user New user: backup user. Create role New role: Hr Manager. Assign the role User > Roles tab > Edit > add Hr Manager. Restrict menu and module Add Hr Manager to the roles of the application menu and module. Elevate and create ACLs Elevate to security_admin, then create read and write ACLs that require Hr Manager.	Impersonate the HR manager Open Employee Training Records. Review the records List shows completion date, employee, status and training name. Impersonate another user Search for the table. Report the result Record the outcome in the UAT report.
Interactions Where do they work and what do they touch?	Google Sheets or Excel All > System Definition > Tables Table form: Columns tab and the Status dictionary entry (Choices tab)	Google Sheets or Excel System Import Sets > Load Data Import set table u_employee_training Progress screen with next-step links	System Import Sets > Administration > Transform Maps Field Maps related list Related Links: Transform Form layout (Configure > Form Layout)	User Administration > Users and Roles Application Menu and Module forms (Roles field) Profile > Elevate Role dialog Access Control (ACL) form	Profile > Impersonate User Employee Training Records list and form Navigator search box
Goals & motivations At each step, what is a person's	Help me get this training data into one system Help me link every record to an employee	Help me get the file in without typing each record Help me know the load worked	Help me connect columns to the right fields Help me move the rows into the real table	Help me give access only to the right people Help me protect personal data	Help me confirm the right people have access Help me prove that others do not

SCENARIO Importing, mapping, securing, and testing employee training data from a spreadsheet	Entice How does the need first come up?	Enter What do people experience as they begin the process?	Engage In the core moments in the process, what happens?	Exit What do people experience as the process finishes?	Extend What happens after the process is over?
primary goal? ("Help me...")			Help me see the department without typing it		
Positive moments Which steps feel easy, fast, or satisfying?	The table form creates the menu and module for me The reference field links to sys_user in one step	Column headers become import set fields The progress screen shows State Complete and Success	Transform finishes with Transformation complete Department shows on the form and list	The Hr Manager role appears on the user's Roles tab Read and write ACLs are clear and separate	The HR manager can see and edit the records Other users cannot see the table
Negative moments Which steps feel frustrating, confusing, or slow?	Choice values must be right from the start, or later rows will not match	Empty rows are skipped (one empty row was ignored) Wrong sheet number or header row loads the wrong data	A field map pointing to the wrong source column (u_employee_email instead of u_employee) leaves the field empty A status such as Not Started is not in the choice list	ACLs cannot be created until security_admin is elevated Easy to forget the role on the module	Testing means switching between users several times
Areas of opportunity How might we make each step better?	Create the choices from the exact status values in the sheet	Remove blank rows before uploading Test with a few rows first	Use Auto Map Matching Fields and check each map Set coalesce so reruns update instead of duplicate Add the missing choice or clean the sheet	Name roles clearly (Hr Manager) Repeat the read ACL steps for write access	Add a read-only role Report training status by department Schedule imports for new spreadsheets
