

Problem-Solution Fit Canvas: Import Data Using Transform Maps (Spreadsheet)

Purpose / Vision: make bulk data loading from spreadsheets fast, accurate and repeatable.

1. CUSTOMER SEGMENT(S) • Administrators, analysts and developers who must load bulk data (users, CIs, incidents, assets) from spreadsheets (Excel/CSV) into the platform • Business teams that maintain master data in spreadsheets	6. CUSTOMER CONSTRAINTS • Limited technical skill / no scripting knowledge • Data in inconsistent formats (dates, references, choice values) • Need to avoid duplicates and bad data in production • Time pressure; restricted access to production tables	5. AVAILABLE SOLUTIONS • Manual entry record by record: slow, error-prone • Direct DB/SQL or API scripts: need expertise • Plain spreadsheet import without mapping: wrong fields, no validation • Pros/cons: manual is simple but not scalable; scripts are powerful but costly to maintain
2. JOBS-TO-BE-DONE / PROBLEMS • Import spreadsheet data into target tables accurately and quickly • Map source columns to target fields and convert values (coalesce, reference lookups, scripts) • Update existing records without creating duplicates • Verify results and handle errors	9. PROBLEM ROOT CAUSE • Source data structure differs from the target table schema • No standard way to transform and validate data on load • Data is scattered across spreadsheets owned by many teams • Migrations and onboarding repeatedly require bulk loads	7. BEHAVIOUR • Clean spreadsheet columns and headers by hand • Upload file to an import set (staging) table • Build/adjust field maps and run the transform map • Review import logs and fix rejected rows, then re-run • Indirect: ask colleagues for templates; keep spreadsheets as backup
3. TRIGGERS • Data migration or new system rollout • Large user/asset list arrives from HR, vendor or client • Repeated data errors from manual entry • Management asks for fast, consistent data loading	4. EMOTIONS: BEFORE / AFTER • Before: overwhelmed, anxious about data corruption, frustrated by rework • After: confident, in control, saves time, trusts data quality	8. CHANNELS OF BEHAVIOUR • 8.1 ONLINE: upload Excel/CSV via Data Source / Import Sets, create transform map, run transform, inspect import set rows and logs, read documentation/community forums • 8.2 OFFLINE: prepare and cleanse data in spreadsheets, discuss mapping rules with data owners, training sessions, internal team meetings
10. YOUR SOLUTION • Spreadsheet-driven import using Data Source + Import Set (staging table) + Transform Map: upload file, auto-map or define field maps, apply transform scripts/coalesce on key fields, run transform and review results • Fits constraints (no coding for most cases, validation via coalesce/scripts), solves the mapping and duplicate problem, and matches the behaviour of users who already work in spreadsheets
